Builders Panel

Panel Abstract

What we would like to see in your presentation

In this final step of the recruitment process, you will deliver a 45-minute presentation, introducing yourself as a candidate, and introduce us an agent that you built.

The presentation should be structured into 4 chapters:

1. **Introduction (5 min.)** – Brief introduction of yourself.
2. **In the 30-minute** Asset section, describe and show a working AI agent you have built. Walk us through what it does, how it is put together, and where its edges are. We are looking for the following four areas**:**
    - **The Agent (what it is) –** What is the agent's purpose, who is the user, and what job-to-be-done does it perform? What outcome does a successful run produce, and how do you measure it?
    - **AI Tooling (how it is built) –** Which model, tools/MCPs, data sources, memory, and orchestration layer did you choose? Explain the rationale behind each choice and how the pieces fit together end-to-end.
    - **Boundaries & Guardrails (where it must not go) –** What is in and out of scope? What safety, policy, and data-access controls did you put in place? Where does a human stay in the loop, and what triggers an escalation or refusal?
    - **Issues & Trade-offs (what you learned the hard way) –** What failure modes did you encounter, what trade-offs did you have to make (cost, latency, accuracy, autonomy), and how did you detect, fix, or mitigate them? What would you change with more time**?**
3. **Why me (10 min.)** – Describe what makes you the ideal candidate for the Forward Deployment Engineer role.
4. **Q&A (10 min.)**

Elements that should transpire in your talk track

Agent Impact: Significance of the problem the agent addresses and the outcome it moves.

Individual Technical Contribution: Clarity of the candidate's hands-on work – prompts, tools, integrations, evals, and code they personally owned.

Strategic Alignment: Understanding of the user, the job-to-be-done, and the success metric the agent was built to serve.

Business Fit: How the agent slots into the surrounding business process – what it replaces, accelerates, or unblocks.

Technical Vision: Rationale for the chosen model, tools/MCPs, data, memory, and orchestration, and why over the alternatives.

Boundaries & Guardrails: Clarity of scope, safety controls, data access limits, human-in-the-loop points, and escalation paths.

Reliability & Evaluation: Awareness of failure modes, trade-offs (cost, latency, accuracy, autonomy), and how the agent is tested, monitored, and improved.

Explanation & Justification: Clarity and reasoning behind design choices, refusals, and open issues.

Soft Skills & Time Management: Communication, presence, and ability to structure the narrative within the allocated time.

Thank You
